Use minisetts to rapidly increase the quantity and the quality of your seed yam. Follow the simple steps below to enhance the quality and yield of seed tubers produced.

1. Select healthy mother seed tubers that have young sprouts.

2. Cut tubers into minisetts of 25–80 g depending on size of seed tuber desired.

3. Treat freshly cut minisetts in mixture of fungicide (e.g., Mancozeb 100 g) and insecticide (e.g., Chlorpyriforce, 70 ml) in 10 L of water.

4. Spread out treated minisetts under shade (under tree or well-ventilated enclosure) for 12 to 48 hours to dry.

5. Plant minisetts in the field on ridges at a spacing of 100 cm × 25–30 cm.

6. Maintain the crop well to keep plants free of weeds, pests, and diseases.

7. Harvest quality seed tubers for sale or use in ware yam production.
